

Process Flow Visual

Visualize your business processes, including automatic variant computation and key metrics

Uncover hidden information in your process data. The Process Flow visual takes your event log — tickets, tasks, activities — and turns it into a clear, interactive map of how work actually moves through your organization, so you can spot bottlenecks and act on them.

How it works

Process Flow reads your event log and automatically computes every process variant, highlighting the main path with a heavier line so the dominant route through your process is obvious at a glance. Case counts and average durations sit right on the diagram, and everything from event size to alignment can be tuned to match your report.

What's included

Core capabilities plus the fine-grained controls that show up once you're deep in analysis.

Automatic Variant Detection

Every path through your process is computed automatically, ranked, and ready to filter — no manual mapping required.

Variant Zoom

Step through five levels of detail, from the single main path to the full picture, to control how much noise you see.

NEW

Smart Tooltips

Surface any data field on hover, aggregated as sum, average, min, max, first, or last — right where you need it.

NEW

Minimap Navigation

Large, complex process graphs get a minimap panel so you never lose your place while exploring.

NEW

Key Metrics, Out of the Box

Case, variant, and event counts plus average lead time, shown as clean gauges beside the flow.

Full Visual Customization

Event boxes, connecting lines, and count badges are all styled to fit your report's look and feel.

Platform

Certified visual for Power BI

Availability

Free tier to get started, AppSource plans for growing teams, and a custom license for enterprise-scale deployments
